Pre-training + Fine-tuning Paradigm 2

Ling 282/482: Deep Learning for Computational Linguistics
C.M. Downey
Fall 2025

Pre-trained Transformers: Decoder-only

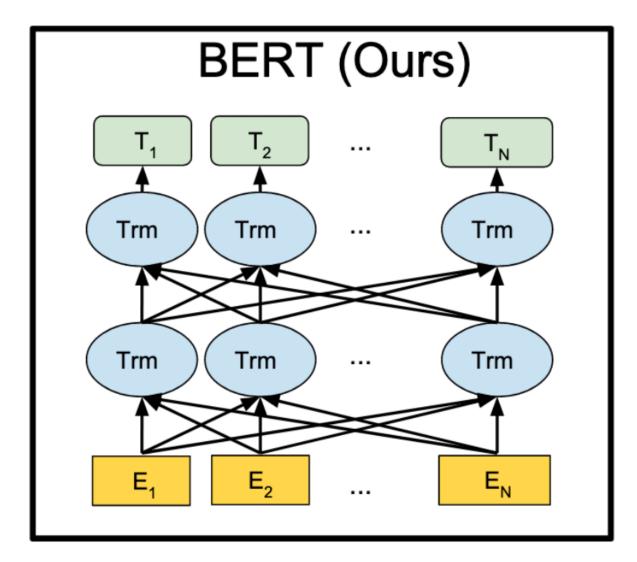

- Generative Pre-training
 - Radford et al <u>2018</u>; <u>2019</u> (GPT-2); Brown et al <u>2020</u> (GPT-3)

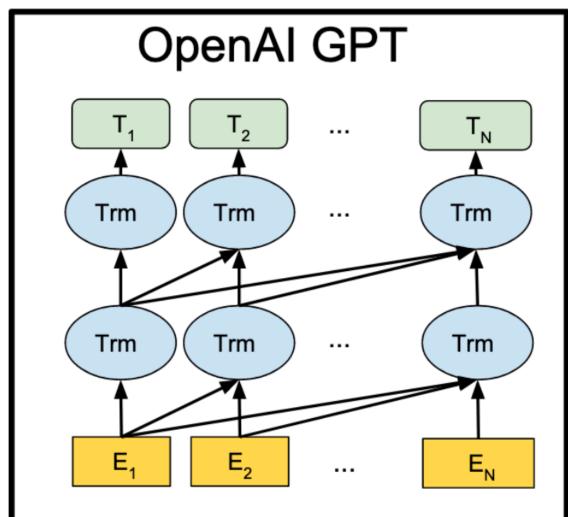

- Generative Pre-training
 - Radford et al <u>2018</u>; <u>2019</u> (GPT-2); Brown et al <u>2020</u> (GPT-3)
- Uses Transformer decoder instead of encoder
 - Masked self-attention: model can only can attend to previous tokens
 - Pure LM training objective (GPT-2, GPT-3 only)
 - Can be used for text generation

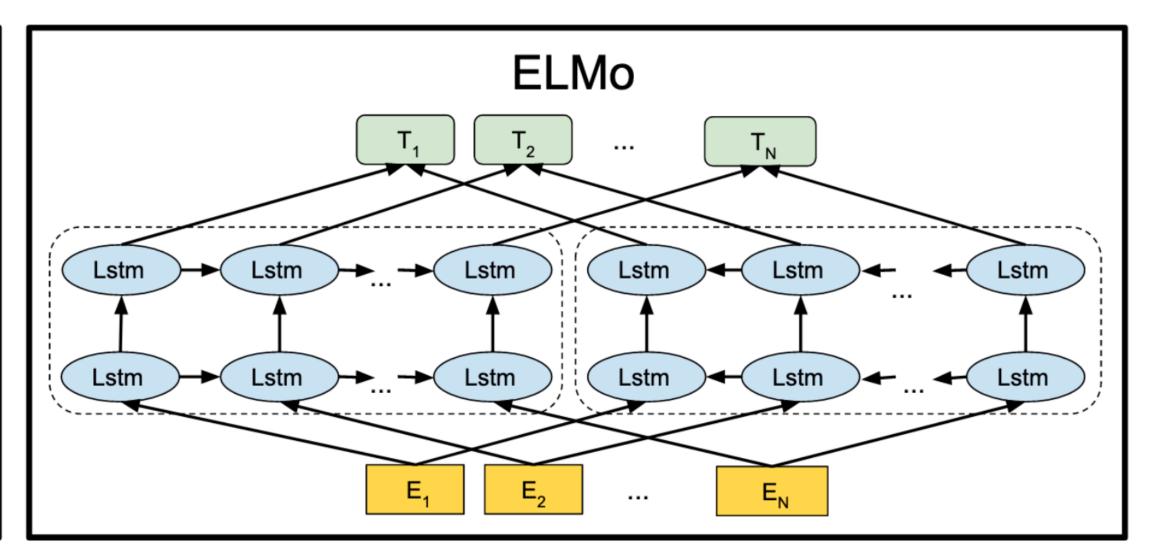

- Generative Pre-training
 - Radford et al <u>2018</u>; <u>2019</u> (GPT-2); Brown et al <u>2020</u> (GPT-3)
- Uses Transformer decoder instead of encoder
 - Masked self-attention: model can only can attend to previous tokens
 - Pure LM training objective (GPT-2, GPT-3 only)
 - Can be used for text generation
- GPT: same params as BERT-base; GPT-2 much bigger; GPT-3 muuuch bigger (175B params)

- Generative Pre-training
 - Radford et al <u>2018</u>; <u>2019</u> (GPT-2); Brown et al <u>2020</u> (GPT-3)
- Uses Transformer decoder instead of encoder
 - Masked self-attention: model can only can attend to previous tokens
 - Pure LM training objective (GPT-2, GPT-3 only)
 - Can be used for text generation
- GPT: same params as BERT-base; GPT-2 much bigger; GPT-3 muuuch bigger (175B params)
- Training data: **crawled** from outbound Reddit links w/ >3 karma, not public

Comparison

Samples from GPT-2 (Cherry-picked)

SYSTEM PROMPT (HUMAN-WRITTEN) A train carriage containing controlled nuclear materials was stolen in Cincinnati today. Its whereabouts are unknown.

MODEL
COMPLETION
(MACHINEWRITTEN, FIRST
TRY)

The incident occurred on the downtown train line, which runs from Covington and Ashland stations.

In an email to Ohio news outlets, the U.S. Department of Energy said it is working with the Federal Railroad Administration to find the thief.

"The theft of this nuclear material will have significant negative consequences on public and environmental health, our workforce and the economy of our nation," said Tom Hicks, the U.S. Energy Secretary, in a statement. "Our top priority is to secure the theft and ensure it doesn't happen again."

The stolen material was taken from the University of Cincinnati's Research Triangle Park nuclear research site, according to a news release from Department officials.

The Nuclear Regulatory Commission did not immediately release any information.

Samples from GPT-2 (Cherry-picked)

SYSTEM PROMPT (HUMAN-WRITTEN)

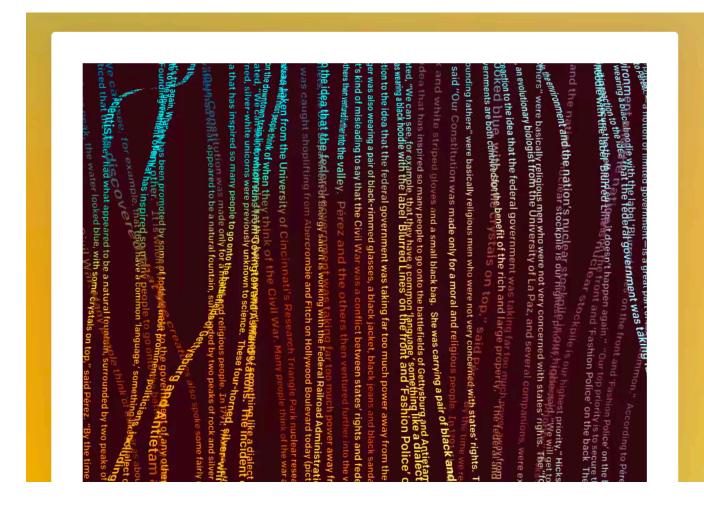

Recycling is good for the world.

NO! YOU COULD NOT BE MORE WRONG!!

MODEL COMPLETION (MACHINE-WRITTEN, 25 TRIES) Recycling is NOT good for the world. It is bad for the environment, it is bad for our health, and it is bad for our economy. I'm not kidding. Recycling is not good for the environment. It is destructive to the earth and it is a major contributor to global warming. Recycling is not good for our health. It contributes to obesity and diseases like heart disease and cancer. Recycling is bad for our economy. It increases the cost of a product, and in turn, the price of everything that is made with that product. Recycling is not good for our nation. We pay a tremendous price for the privilege of having the world's most advanced and efficient recycling system. Recycling is a huge, colossal waste of time, energy, money, and resources. And THAT is why we need to get back to basics and get back to basics in our recycling efforts. One of the best ways to start is to look at the process of creating a paper product. When you make a paper product, it is basically a long chain of materials. Everything from the raw materials (wood, cardboard, paper, etc.), to the reagents (dyes, solvents, etc.) to the printing equipment (chemicals, glue, paper, ink, etc.), to the packaging, to the packaging materials (mercury, chemicals, etc.) to the processing equipment (heating, cooling, etc.), to the packaging materials, to the packaging materials that are shipped overseas and to the packaging materials that are used in the United States. Each step along the way creates tons of waste that we constantly have to clean up. The process

GPT-2 Release Controversy

- Worry: it's so good, it could be used by malicious actors to make deepfakes for text (incl. fake news, character assassination, ...)
- So the model was not released until a <u>partially independent report</u> on possible misuses

Better Language Models and Their Implications

We've trained a large-scale unsupervised language model who coherent paragraphs of text, achieves state-of-the-art performany language modeling benchmarks, and performs rudiment comprehension, machine translation, question answering, and summarization—all without task-specific training.

Write With Transformer

- Prompt: Studying computational linguistics is a good idea. There are many interesting problems.
- However, there are many bad problems. The research into computational linguistics has not helped very much in the development of better solutions. One problem with computer science and machine learning is that, until recently, the problems they were supposed to solve were insufficiently well studied. Most of the people who are doing research in computer science (at least in my profession) have no understanding of how to design a particularly natural problem, for example. In the case of the reasoning problem above, most of the people I know who work on computer science or machine learning have no understanding of how to make computer programs work in ways which do not have unavoidable adverse consequences. In the best cases, computational linguistics was little help.

Write With Transformer

- Prompt: I didn't ride my bike to campus today because of the snowy weather.
- There is a lot of construction and I wanted to have a few hours of skiing. All that snow is a real pain in the ass. Good thing there was an LRT planned for that area. See you guys on campus in a few days! Photo credit: Tapto@archivosos.gr
 - August 26, 2016: Windy Weather on the Mountain (photo credit: Diana Prat) From Diana Prat, via tapto@archivosos.gr:
 - Ever since the camp that I organized to protest the modernisation of the Barranco, my beautiful alma mater, you know, going in for a press conference, I was asking why the Italian government

...fast-forward to ChatGPT

I didn't ride my bike to campus today because of the snowy weather.

It's understandable that you didn't ride your bike to campus today due to the snowy weather. Riding a bike in such conditions can be dangerous and difficult. It's important to prioritize your safety and well-being when making decisions like this. Is there anything else you would like to know or talk about?

(What is the main difference in behavior?)

GPT-3

- Same approach: pure transformer decoder trained on LM
 - Scale: 175B params
 - Data size: ~500 billion tokens, majority
 from filtered Common Crawl
- Few-shot "fine-tuning" paradigm:
 - Prompt with a few examples, ask to continue
 - No parameter updates
 - See "in-context learning" in a few slides

The three settings we explore for in-context learning

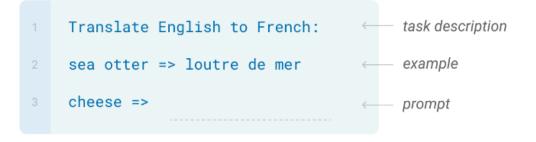

Zero-shot

The model predicts the answer given only a natural language description of the task. No gradient updates are performed.

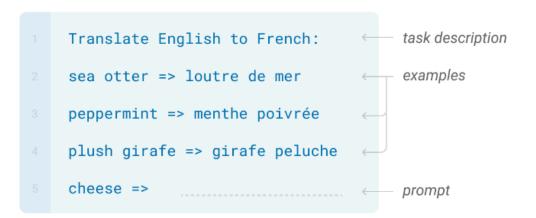

One-shot

In addition to the task description, the model sees a single example of the task. No gradient updates are performed.

Few-shot

In addition to the task description, the model sees a few examples of the task. No gradient updates are performed.

Traditional fine-tuning (not used for GPT-3)

Fine-tuning

The model is trained via repeated gradient updates using a large corpus of example tasks.

GPT-3 Few-Shot Results

	SuperGLUI	E BoolQ	CB	CB	COPA	RTE
	Average	Accuracy	y Accurac	y F1	Accuracy	Accuracy
Fine-tuned SOTA	89.0	91.0	96.9	93.9	94.8	92.5
Fine-tuned BERT-Large GPT-3 Few-Shot	69.0	77.4	83.6	75.7	70.6	71.7
	71.8	76.4	75.6	52.0	92.0	69.0
	WiC	WSC	MultiRC	MultiRC	ReCoRD	ReCoRD
	Accuracy	Accuracy	Accuracy	F1a	Accuracy	F1
Fine-tuned SOTA Fine-tuned BERT-Large GPT-3 Few-Shot	76.1 69.6 49.4	93.8 64.6 80.1	62.3 24.1 30.5	88.2 70.0 75.4	92.5 71.3 90.2	93.3 72.0 91.1

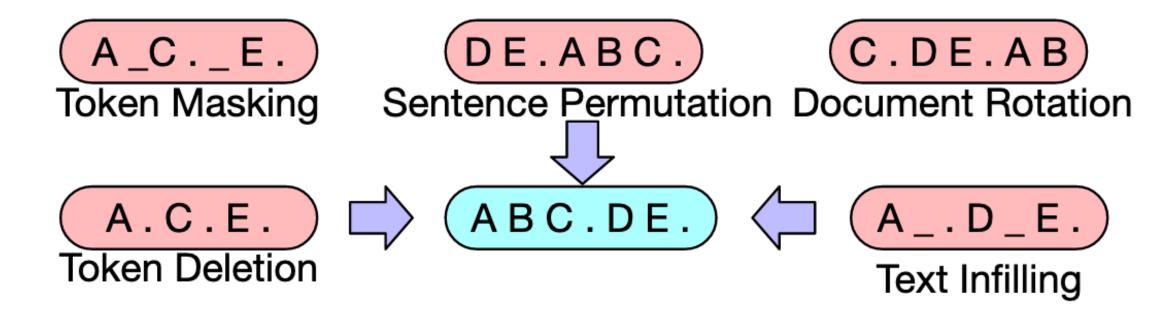

Some follow-ups on GPT-3

- Has ushered in a lot of work on "prompt tuning": how to best engineer the prompts to produce the behavior that you want
 - Very useful survey paper/website on that front: http://pretrain.nlpedia.ai/
- Putting the "open" back in:
 - <u>EleutherAl</u>: "A grassroots collective of researchers working to open source Al research."
 - Reproduce GPT-like models + datasets in entirely open way
 - OPT-175B: Meta's open (incl logbook, etc) non-commercial replication

Pretrained Transformers: Encoder-Decoder

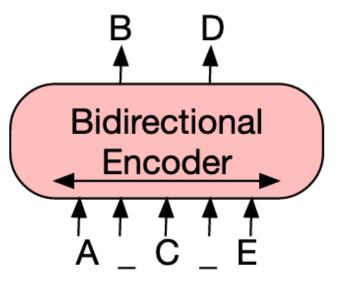

BART

- Full transformer, i.e. encoder-decoder
 - Many composable transformations of raw text, presented to encoder
 - Goal of decoder is to reconstruct the original text

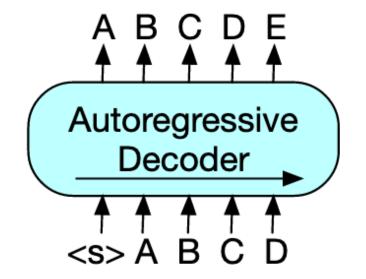

Good for both discrimination and generation

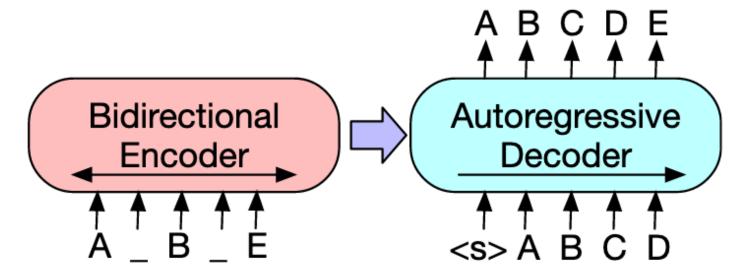

High-level Overview

(a) BERT: Random tokens are replaced with masks, and the document is encoded bidirectionally. Missing tokens are predicted independently, so BERT cannot easily be used for generation.

(b) GPT: Tokens are predicted auto-regressively, meaning GPT can be used for generation. However words can only condition on leftward context, so it cannot learn bidirectional interactions.

(c) BART: Inputs to the encoder need not be aligned with decoder outputs, allowing arbitary noise transformations. Here, a document has been corrupted by replacing spans of text with mask symbols. The corrupted document (left) is encoded with a bidirectional model, and then the likelihood of the original document (right) is calculated with an autoregressive decoder. For fine-tuning, an uncorrupted document is input to both the encoder and decoder, and we use representations from the final hidden state of the decoder.

Comparison of Pre-training Objectives

Model	SQuAD 1.1 F1	MNLI Acc	ELI5 PPL	XSum PPL	ConvAI2 PPL	CNN/DM PPL
BERT Base (Devlin et al., 2019)	88.5	84.3	-	-	-	-
Masked Language Model	90.0	83.5	24.77	7.87	12.59	7.06
Masked Seq2seq	87.0	82.1	23.40	6.80	11.43	6.19
Language Model	76.7	80.1	21.40	7.00	11.51	6.56
Permuted Language Model	89.1	83.7	24.03	7.69	12.23	6.96
Multitask Masked Language Model	89.2	82.4	23.73	7.50	12.39	6.74
BART Base						
w/ Token Masking	90.4	84.1	25.05	7.08	11.73	6.10
w/ Token Deletion	90.4	84.1	24.61	6.90	11.46	5.87
w/ Text Infilling	90.8	84.0	24.26	6.61	11.05	5.83
w/ Document Rotation	77.2	75.3	53.69	17.14	19.87	10.59
w/ Sentence Shuffling	85.4	81.5	41.87	10.93	16.67	7.89
w/ Text Infilling + Sentence Shuffling	90.8	83.8	24.17	6.62	11.12	5.41

Advantages of Encoder-Decoder Models

- "Best of both worlds"
 - On a par with RoBERTa on NLU / discrimination tasks
 - State-of-the-art on many generation tasks (e.g. summarization, translation)
- Others:
 - MASS
 - <u>T5</u>
 - Uses labeled data
 - "Unified" text-to-text format

Source Document (abbreviated)

The researchers examined three types of coral in reefs off the coast of Fiji ... The researchers found when fish were plentiful, they would eat algae and seaweed off the corals, which appeared to leave them more resistant to the bacterium Vibrio corallilyticus, a bacterium associated with bleaching. The researchers suggested the algae, like warming temperatures, might render the corals' chemical defenses less effective, and the fish were protecting the coral by removing the algae.

Sacoolas, who has immunity as a diplomat's wife, was involved in a traffic collision ... Prime Minister Johnson was questioned about the case while speaking to the press at a hospital in Watford. He said, "I hope that Anne Sacoolas will come back ... if we can't resolve it then of course I will be raising it myself personally with the White House."

BART Summary

Fisheries off the coast of Fiji are protecting coral reefs from the effects of global warming, according to a study in the journal Science.

Boris Johnson has said he will raise the issue of US diplomat Anne Sacoolas' diplomatic immunity with the White House.

Multilingual Pre-training

- One other main dimension: mono- vs multi-lingual pre-training
 - Roughly: concatenate (in fancy way) corpora from many languages, then do the same kind of pre-training
 - Much more info in upcoming lecture on multilingual NLP

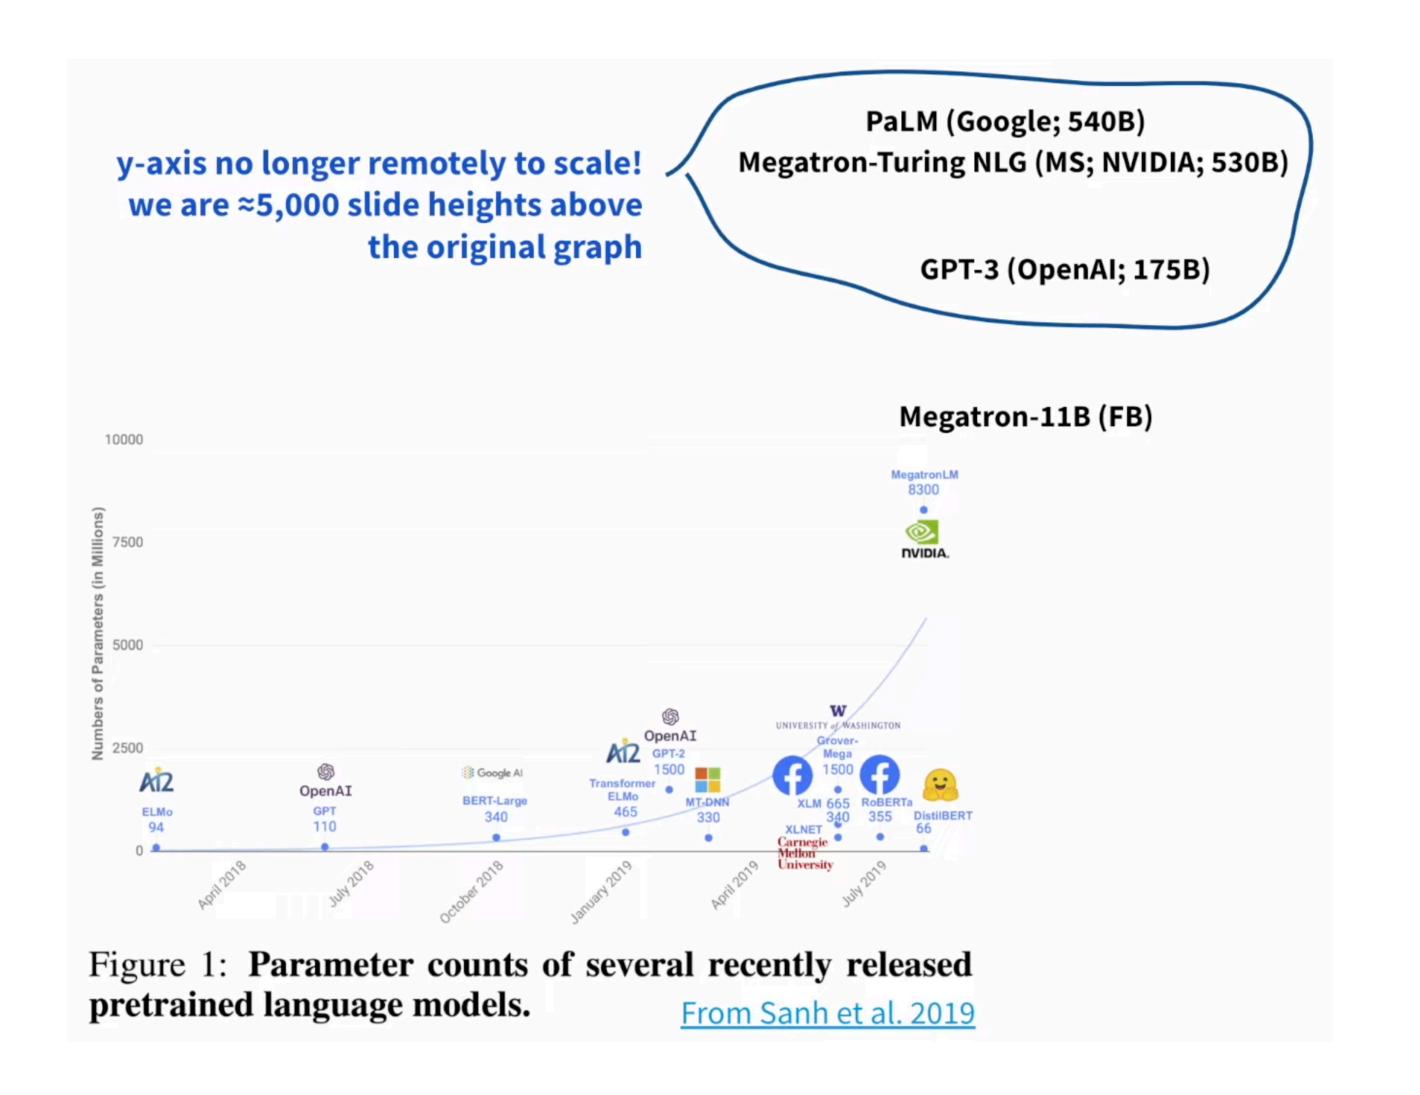

English-only * BERT	, RoBERTa, XLNet, ALBERT,	GPT-n, many others	BART
Multilingual mB	ERT, XLM(-R),	BLOOM, XGLM, Aya	mBART, MASS, mT5

Limitations of Pre-training + Fine-tuning

State of the Field

- Manning 2017: "The BiLSTM Hegemony"
- ~2018-2022: "The Pre-trained Transformer Hegemony"
 - By default: fine-tune a large pre-trained Transformer on the task you care about
 - Will often yield the best results
 - Beware: often not significantly better than very simple baselines (SVM, etc)
- Now: "The LLM-prompting Hegemony"
 - Actually fine-tuning models is less common
 - Some exceptions, as with all these "hegemonies"

Scale scale scale

More Comprehensive

LANGUAGE MODEL SIZES TO MAR/2023

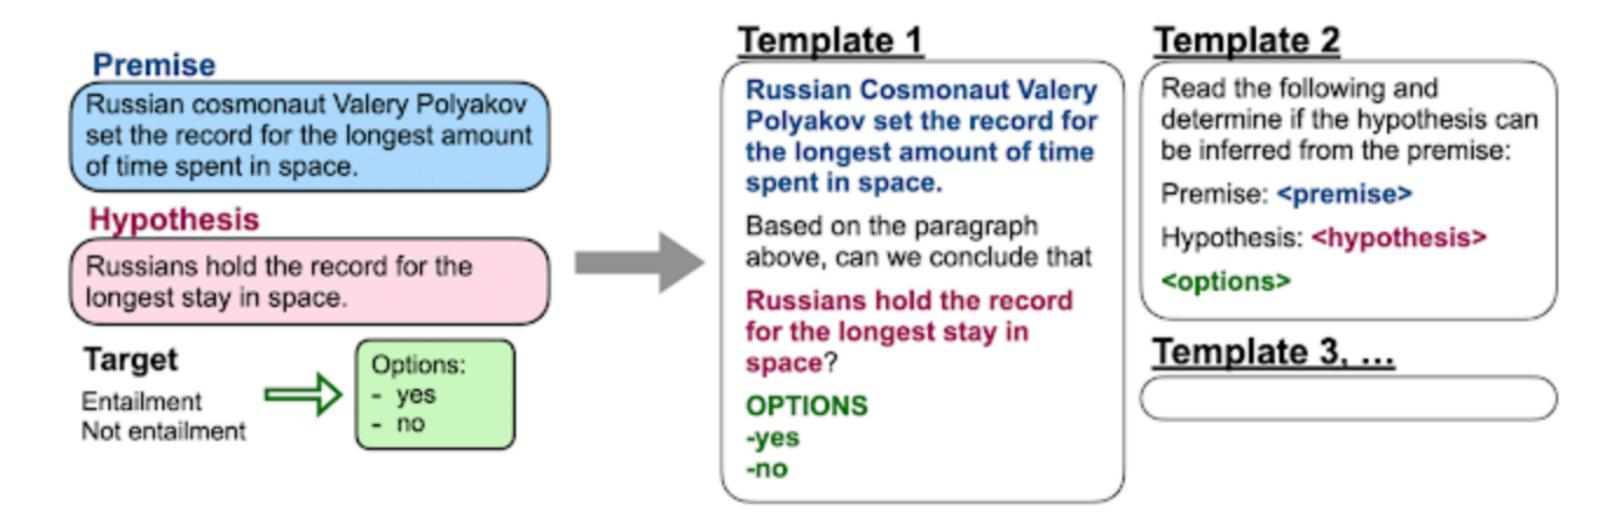

LifeArchitect.ai/models

Towards Modern "LLMs"

- Instruction Fine-tuning
 - Large models are fine-tuned with various natural-language cast as language modeling; i.e. have the model answer using language
 - examples: Google's FLAN (137B), OpenAl's davinci, Stanford Alpaca (7B)

Towards Modern "LLMs"

- "In-Context Learning"
 - Models so large that it's impractical to fine-tune
 - Instead, design ways to "prompt" the model to get the results you want
 - Model takes in task prompt as input to be continued as language-modeling
 - So-called "prompt engineering"
 - Many models now only have API access
 - i.e. user can give a prompt, get outputs and sometimes final probabilities
 - No access to model weights
 - ChatGPT has sent this paradigm into hyperdrive

Towards Modern "LLMs"

RLHF

- (Reinforcement Learning from Human Feedback)
- Key idea: have annotators rate the relative "quality" or "acceptability" of generations
- Hard to use human feedback at large scale
 - Train a small, auxillary model to replicate human judgements
 - Have the auxillary model provide acceptability judgements as loss
- One of the key ingredients of ChatGPT

Energy and Policy Considerations for Deep Learning in NLP

Emma Strubell Ananya Ganesh Andrew McCallum
College of Information and Computer Sciences
University of Massachusetts Amherst
{strubell, aganesh, mccallum}@cs.umass.edu

Abstract

Recent progress in hardware and methodology for training neural networks has ushered in a new generation of large networks trained on abundant data. These models have obtained notable gains in accuracy across many NLP tasks. However, these accuracy improvements depend on the availability of exceptionally large computational resources that necessitate similarly substantial energy consumption. As a result these models are costly to train and develop, both financially, due to the cost of hardware and electricity or cloud compute time, and environmentally, due to the carbon footprint required to fuel modern tensor

Consumption	CO_2e (lbs)	
Air travel, 1 person, NY↔SF	1984	
Human life, avg, 1 year	11,023	
American life, avg, 1 year	36,156	
Car, avg incl. fuel, 1 lifetime	126,000	
Training one model (GPU)		
Training one model (GPU) NLP pipeline (parsing, SRL)	39

July 2019

Abstract

The computations required for deep learning research have been doubling every few months, resulting in an estimated 300,000x increase from 2012 to 2018 [2]. These computations have a surprisingly large carbon footprint [40]. Ironically, deep learning was inspired by the human brain, which is remarkably energy efficient. Moreover, the financial cost of the computations can make it difficult for academics, students, and researchers, in particular those from emerging economies, to engage in deep learning research.

This position paper advocates a practical solution by making efficiency an evaluation criterion for research alongside accuracy and related measures. In addition, we propose reporting the financial cost or "price tag" of developing, training, and running models to provide baselines for the investigation of increasingly efficient methods. Our goal is to make AI both greener and more inclusive—enabling any inspired undergraduate with a laptop to write high-quality research papers. Green AI is an emerging focus at the Allen Institute for AI.

ABSTRACT

The past 3 years of work in NLP have been characterized by the development and deployment of ever larger language models, especially for English. BERT, its variants, GPT-2/3, and others, most recently Switch-C, have pushed the boundaries of the possible both through architectural innovations and through sheer size. Using these pretrained models and the methodology of fine-tuning them for specific tasks, researchers have extended the state of the art

Timnit Gebru*
timnit@blackinai.org
Black in AI
Palo Alto, CA, USA

Shmargaret Shmitchell shmargaret.shmitchell@gmail.com The Aether

alone, we have seen the emergence of BERT and its variants [39, 70, 74, 113, 146], GPT-2 [106], T-NLG [112], GPT-3 [25], and most recently Switch-C [43], with institutions seemingly competing to produce ever larger LMs. While investigating properties of LMs and how they change with size holds scientific interest, and large LMs have shown improvements on various tasks (§2), we ask whether enough thought has been put into the potential risks associated with developing them and strategies to mitigate these risks.

Some Reasons to Pause

- Leaderboard chasing (via larger models and more data) funnels research activity into one specific and limited goal
- Amplifies harmful biases
- Equity costs
- Climate costs
- Data documentation debt

Outsourcing Harmful Content

- OpenAl outsourced labeling of harmful/disturbing content to workers making \$2/hr in Kenya
 - Content warning!
- Essentially: have annotators label content as harmful/inappropriate; use to train model to **not** output such things
 - Employees described having to label large amounts of disturbing content, some of which was illegal
- The takeaway: the success of models like ChatGPT is still largely ensured by annotator labor

Transformers

https://huggingface.co/transformers

Overview of the Library

- Access to many variants of many very large LMs (BERT, RoBERTa,
 XLNET, ALBERT, T5, language-specific models, ...) with fairly consistent
 API
 - Build tokenizer + model from string for name or config
 - Then use just like any PyTorch nn.Module
- Emphasis on ease-of-use
 - E.g. low barrier-to-entry to *using* the models, including for analysis
- Interoperable with PyTorch or TensorFlow 2.0

Example: Tokenization

```
>>> from transformers import AutoTokenizer
>>> tokenizer = AutoTokenizer.from_pretrained("bert-base-cased")
```

Example: Tokenization

```
>>> from transformers import AutoTokenizer
>>> tokenizer = AutoTokenizer.from_pretrained("bert-base-cased")
```

```
>>> tokenizer.decode(encoded_input["input_ids"])
'[CLS] Do not meddle in the affairs of wizards, for they are subtle and quick to anger. [SEP]'
```

Example: Tokenizing a Batch

```
>>> batch_sentences = [
     "But what about second breakfast?",
     "Don't think he knows about second breakfast, Pip.",
     "What about elevensies?",
>>> encoded_input = tokenizer(batch_sentences, padding=True)
>>> print(encoded_input)
{'input_ids': [[101, 1252, 1184, 1164, 1248, 6462, 136, 102, 0, 0, 0, 0, 0, 0],
           [101, 1790, 112, 189, 1341, 1119, 3520, 1164, 1248, 6462, 117, 21902, 1643, 119, 102],
           [101, 1327, 1164, 5450, 23434, 136, 102, 0, 0, 0, 0, 0, 0, 0, 0]],
 'attention_mask': [[1, 1, 1, 1, 1, 1, 1, 1, 0, 0, 0, 0, 0, 0],
              [1, 1, 1, 1, 1, 1, 0, 0, 0, 0, 0, 0, 0, 0]]}
```

Example: Forward Pass

```
>>> from transformers import BertTokenizer, BertModel
>>> import torch

>>> tokenizer = BertTokenizer.from_pretrained("bert-base-uncased")
>>> model = BertModel.from_pretrained("bert-base-uncased")

>>> inputs = tokenizer("Hello, my dog is cute", return_tensors="pt")
>>> outputs = model(**inputs)

>>> last_hidden_states = outputs.last_hidden_state
```

More on HuggingFace
